

Phase 4: Process Automation (Admin) — Tutor Match CRM

In this phase, we automate the essential operational workflows of Tutor Match CRM using Salesforce declarative tools. The objective: reduce manual work for parents, tutors, and admin staff; ensure notifications, follow-ups, and data consistency.

1) Validation Rules

Use: Enforce data integrity before saving records.

Implementation in Tutor Match:

2) Workflow Rules (legacy)

Use: Automate simple actions like email alerts or field updates.

Implementation in Tutor Match:

- **Workflow on Booking:** When booking is created with status = "Confirmed"
 - **Immediate Action:** Send an Email Alert to tutor & parent
 - **Result:** Stakeholders are instantly notified of confirmed bookings
 - (Note: for new projects, replace with Flow whenever possible because Salesforce is pushing automation to Flow.)

3) Process Builder

Use: Intermediate automation with branching, invocation, etc.

Implementation in Tutor Match:

- On Booking creation, if booking's **Source** = "**Website**", then set a custom field Booking_Channel__c = "Website"

4) Approval Process

Use: Standardize approval steps for critical requests or conditions.

Implementation in Tutor Match:

- Example: **Discount Approval for Package**
 - A tutor or parent applies a discount request on a package purchase
 - Step 1:** Counselor submits discount on Booking
 - Step 2:** Manager reviews the request
 - If approved:** update Discount__c, status becomes Approved
 - If rejected:** status = Rejected
 - This ensures unauthorized discounts or changes are controlled

Email Alerts

Use: Automatically notify users of important events.

Implementation in Tutor Match:

- Create email templates (Lightning / Classic) like Booking_Confirmation_Email
- Use via Workflow or Flow: e.g. after Booking is confirmed, send email to tutor & parent
- Templates include merge fields (Booking Name, Date, Tutor name, etc.)

7) Field Updates

Use: Automatically change field values based on conditions.

Implementation in Tutor Match:

- Example: When a Booking is approved via Approval Process, set Booking_Status__c = "Confirmed"

- In a Flow: if package has a discount, automatically update
 $\text{Discounted_Price_c} = \text{Package_Price_c} * (1 - \text{Discount_Percent_c})$

8) Tasks

Use: Automatically assign follow-up or action items for users.

Implementation in Tutor Match:

- Flow triggers creating a **Follow-up Task** when a Booking is created
 - **Subject:** Follow up: {Booking Name}
 - **Due Date:** Booking Date or next day
 - **Owner:** Tutor or Parent (or internal coordinator)
- Ensures no appointment or booking is forgotten

9) Custom Notifications

Use: Send in-app and mobile real-time alerts (instead of or alongside emails).

Implementation in Tutor Match:

- Configure a **Custom Notification Type**: e.g. New Booking Alert
- In Flow: after a new Booking is created, use **Send Custom Notification** action to alert the assigned tutor / parent
 - **Title:** “New Booking Received”
 - **Body:** “You have a new booking: {Booking Name}”
 - **Recipient:** Tutor user ID / Parent user Id

Result: real-time, in-app/mobile push notifications, improving responsiveness

Overall Result (for Tutor Match)

- Automations enforce data correctness (via Validation Rules)
-
- Flow automations reduce manual steps (auto-create sessions, cancel sessions, reminders)
- Approval process ensures discounts or special cases don't bypass oversight
- Notifications and tasks guide users so no booking, session, or payment slips through
- The system becomes proactive rather than reactive
