

Phase 6: User Interface Development (UI) – Tutor Match

In this phase, we built a clean and intuitive interface for counselors in the **Tutor Match Console App** using Salesforce Lightning tools. The focus was on giving counselors a **360° view of students**, quick access to tutors, sessions, and courses, and streamlined navigation for follow-ups and enrollments.

1) Lightning App Builder

Created a custom Lightning App: **Tutor Match Console**

Navigation Items added:

- Leads (prospective students)
- Students (Contacts)
- Tutors (custom tab)
- Courses (custom tab)
- Sessions (custom tab)
- Reports

2) Record Pages

Created a custom Record Page for **Student (Contact)** → **Student 360**.

Added components:

- **Highlights Panel** → Shows key student details (Name, Email, Phone, Status).
- **Student360 LWC** → Custom component to display student snapshot.
- **Related Lists** → Sessions, Courses Enrolled, Assigned Tutor.

3) Tabs

Created custom object tabs for:

- **Job_Post__c** (tutoring opportunities created by parents/students)
- **Session__c** (scheduled tutoring sessions)
- **Application__c** (applications submitted by tutors/students)
- **Parent__c** (parent details linked to students)

Added them to the **Tutor Match Console** app navigation.

4) Home Page Layouts

Customized Home Page for counselors in the **Tutor Match Console** app:

- **Added Reports Dashboard** → shows **Job Posts by Status, Applications Summary, Upcoming Sessions**.
- **Added Recent Records component** → quick access to **Students, Tutors, Parents, and Sessions**.

5) Utility Bar

Configured Utility Bar in the app (desktop only):

- Notes → quick note-taking during counseling calls.
- History → navigate back to recently opened records.

For your **Tutor Match project**, the **Utility Bar** is a compact workspace at the bottom of the **Tutor Match Console** app that lets counselors quickly access important tools while working on students, tutors, sessions, and applications

6) LWC (Lightning Web Component)

Built Student360 LWC in VS Code and deployed to Salesforce.

Files created:

- student360.html
- student360.js
- student360.js-meta.xml

☞ Shows student's Name, Email, Phone on Contact Record Page.

7) Apex with LWC

Student360 LWC uses Lightning Data Service (getRecord), so no Apex needed.

Apex service (EnrollmentService.cls) is available if needed later for enrollment actions (e.g., button to enroll student from LWC).

8) Events in LWC

LWC prepared to handle future button events (like "Enroll Student" or "Send SMS").

Currently displays data via reactive UI.

9) Wire Adapters

Used @wire(getRecord) in student360.js to fetch Contact fields (Name, Email, Phone).

Data auto-refreshes when record changes.
